

Computer Networks

Overview of the Physical Layer

David Wetherall (djw@uw.edu)

Professor of Computer Science & Engineering

UNIVERSITY *of* WASHINGTON

Where we are in the Course

- Beginning to work our way up starting with the Physical layer

Scope of the Physical Layer

- Concerns how signals are used to transfer message bits over a link
 - Wires etc. carry analog signals
 - We want to send digital bits

Topics

1. Properties of media
 - Wires, fiber optics, wireless
2. Simple signal propagation
 - Bandwidth, attenuation, noise
3. Modulation schemes
 - Representing bits, noise
4. Fundamental limits
 - Nyquist, Shannon

Simple Link Model

- We'll end with an abstraction of a physical channel
 - ➔ Rate (or **bandwidth**, **capacity**, **speed**) in bits/second
 - ➔ Delay in seconds, related to length

- Other important properties:
 - Whether the channel is broadcast, and its error rate

Message Latency

- Latency is the delay to send a message over a link
 - Transmission delay: time to put M-bit message “on the wire”

$$M/R$$

- Propagation delay: time for bits to propagate across the wire

$$\text{Length} / \frac{2}{3}c = D$$

- Combining the two terms we have: $L = M/R + D$

Message Latency (2)

- Latency is the delay to send a message over a link
 - Transmission delay: time to put M-bit message “on the wire”
$$T\text{-delay} = M \text{ (bits)} / \text{Rate (bits/sec)} = M/R \text{ seconds}$$
 - Propagation delay: time for bits to propagate across the wire
$$P\text{-delay} = \text{Length} / \text{speed of signals} = \text{Length} / \frac{2}{3}c = D \text{ seconds}$$
 - Combining the two terms we have: $L = M/R + D$

Metric Units

- The main prefixes we use:

Prefix	Exp.	prefix	exp.
K(ilo)	10^3	m(illi)	10^{-3}
M(ega)	10^6	μ (micro)	10^{-6}
G(iga)	10^9	n(ano)	10^{-9}

- 
- Use powers of 10 for rates, 2 for storage
 - 1 Mbps = 1,000,000 bps, 1 KB = 2^{10} bytes
 - “B” is for bytes, “b” is for bits 

Latency Examples

- “Dialup” with a telephone modem:

- $D = 5 \text{ ms}$, $R = 56 \text{ kbps}$, $M = 1250 \text{ bytes}$

$$L = 5 \text{ ms} + \frac{1250.8}{56 \cdot 10^3}$$
$$= 184 \text{ ms}$$

- Broadband cross-country link:

- $D = 50 \text{ ms}$, $R = 10 \text{ Mbps}$, $M = 1250 \text{ bytes}$

$$L = 50 \text{ ms} + \frac{1250.8}{10 \cdot 10^6}$$
$$= 50 + \frac{10^4}{10^7}$$
$$= 51 \text{ ms}$$

Latency Examples (2)

- “Dialup” with a telephone modem:
D = 5 ms, R = 56 kbps, M = 1250 bytes
 $L = 5 \text{ ms} + (1250 \times 8) / (56 \times 10^3) \text{ sec} = 184 \text{ ms!}$
- Broadband cross-country link:
D = 50 ms, R = 10 Mbps, M = 1250 bytes
 $L = 50 \text{ ms} + (1250 \times 8) / (10 \times 10^6) \text{ sec} = 51 \text{ ms}$
- A long link or a slow rate means high latency
 - Often, one delay component dominates

Bandwidth-Delay Product

- Messages take space on the wire!

- The amount of data in flight is the bandwidth-delay (BD) product

$$BD = R \times D$$

— Measure in bits, or in messages

Small for LANs, big for “long fat” pipes

Bandwidth-Delay Example

- Fiber at home, cross-country

R=40 Mbps, D=50 ms

$$\begin{aligned} BD &= 40 \cdot 10^6 \cdot 50 \cdot 10^{-3} \\ &= 2000 \times 10^3 \\ &= 250 \text{ KB} \end{aligned}$$

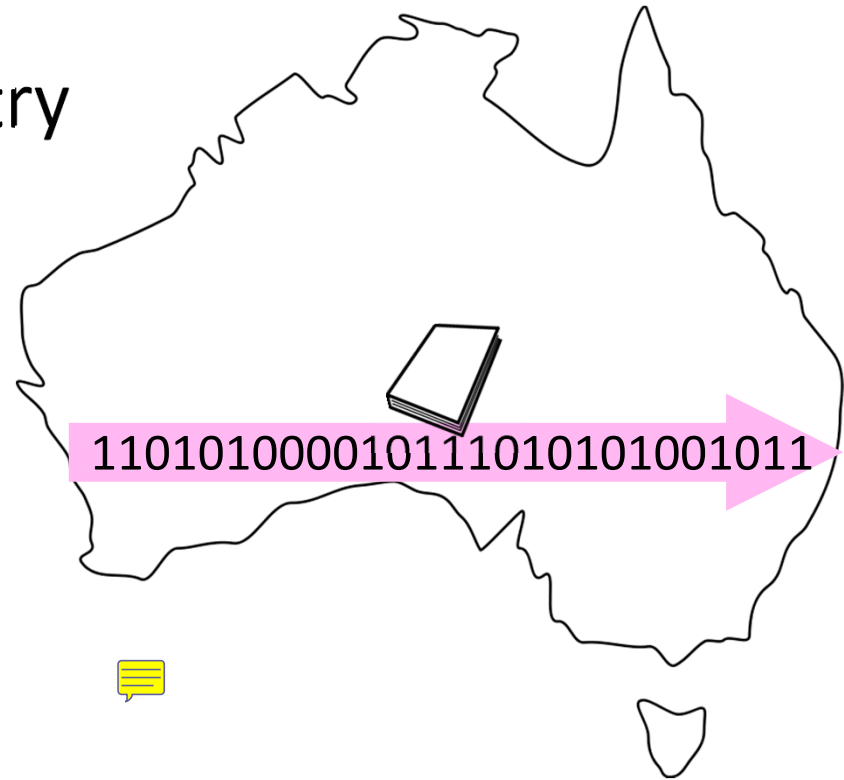

Bandwidth-Delay Example (2)

- Fiber at home, cross-country

$R=40$ Mbps, $D=50$ ms

$$\begin{aligned} BD &= 40 \times 10^6 \times 50 \times 10^{-3} \text{ bits} \\ &= 2000 \text{ Kbit} \\ &= 250 \text{ KB} \end{aligned}$$

- That's quite a lot of data
“in the network”!
